**Application:**

The 600866 is a Motor Speed Control and is intended for use with 12 Volt or 24 Volt PMDC (Permanent Magnet DC) motors, with motor ratings **no larger than 1/2 h.p.** Using the Rocker Switch, select the 12V or 24V battery voltage for your application.

The 600866 must be used in conjunction with a power on/off push button switch and solenoid to turn off power to the reel and disconnect the speed control from the motor wire. See wiring instructions.

The 600866 is used for winding in hose and cable reels. **It cannot be used on labor intensive applications such as jetter hose reels, winching, or pulling up heavy objects through a pipe.**

**Mounting:** Flanges on the enclosure are provided for mounting. You may drill your own holes in the flange.

**Wiring Instructions**

**CAUTION:** The speed control's Black wire is the (-) Negative Battery connection. Do not connect the control's Black wire to the positive Voltage wire coming from the switch, solenoid, or circuit breaker. Connected the control's Black wire to the vehicle frame will create a high resistance to the Battery's (-) Negative Terminal. If the Black wire is connected to the vehicle frame, and not connected directly to the battery, the control's performance and longevity cannot be warranted.

![Diagram of Wiring Instructions](image)

- **Negative (-)**
- **(+ Positive**

**Orange Wire to Motor Side of Solenoid to activate the control when the solenoid is engaged.**

**WHITE Wire to Motor Wire**

- **12 or 24 Volt Battery**
- **Depth= 1.5”**
- **3.5”**
- **6.0”**

**Ground the Solenoid to Vehicle Ground.**

**Monetary (On/Off) Pushbutton Switch to activate solenoid coil.**

**Switch**

**+V Output from Switch**

**12V or 24V DC Motor**

**Exchange these two motor wires to change motor direction.**

Install the Manual Reset Circuit Breaker here if you are concerned with your Positive Battery cable. It is best to install the breaker in the Red wire from the solenoid to the motor.
